

Task

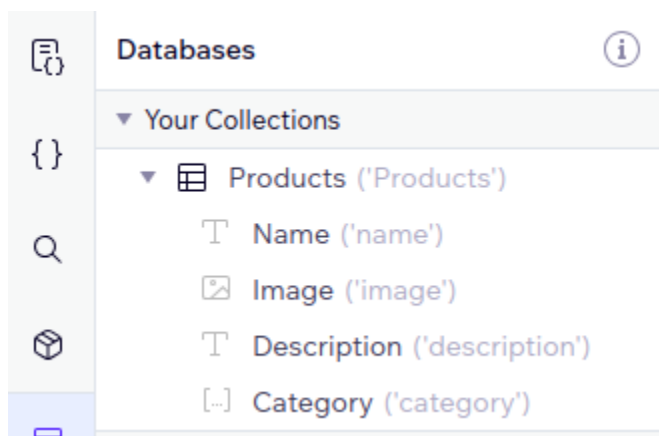

Wix Velo: Using Wix Velo, write a code snippet that retrieves data from a collection (e.g., a list of products) and displays it on a page.

How to setup the project:

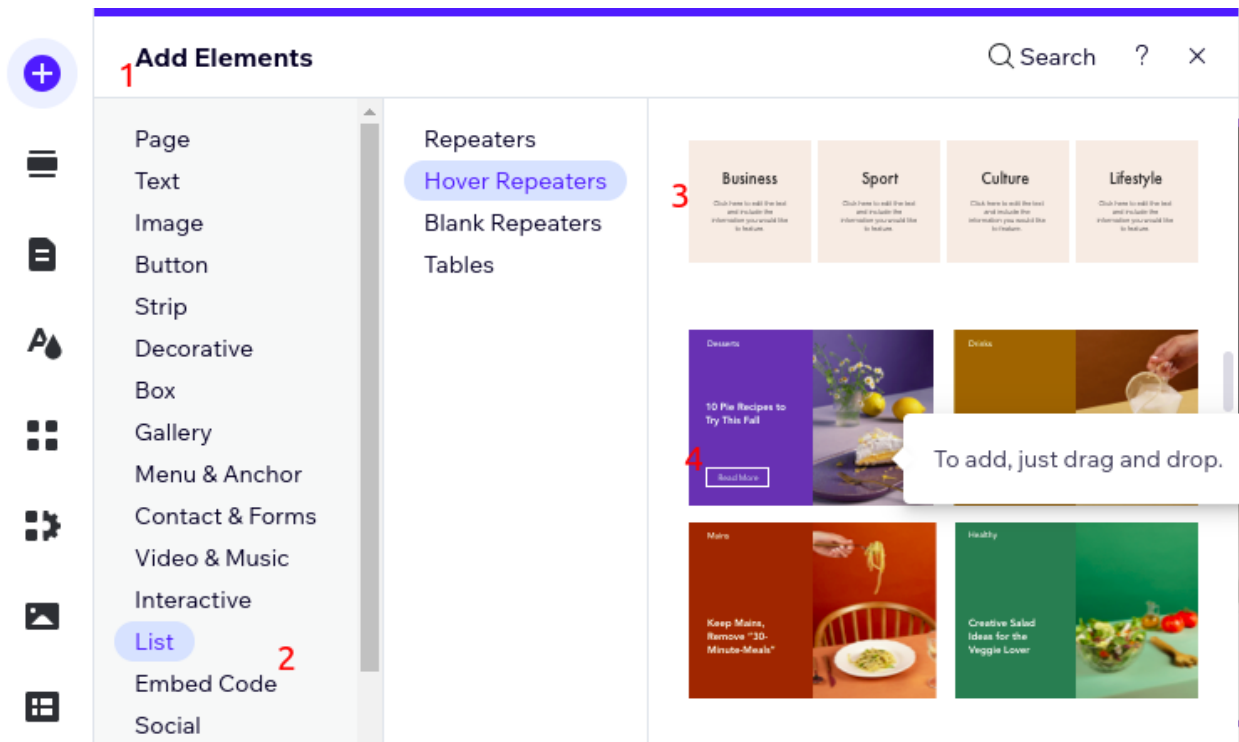

1. Create a Database on Wix's CMS and manually enter the database entries

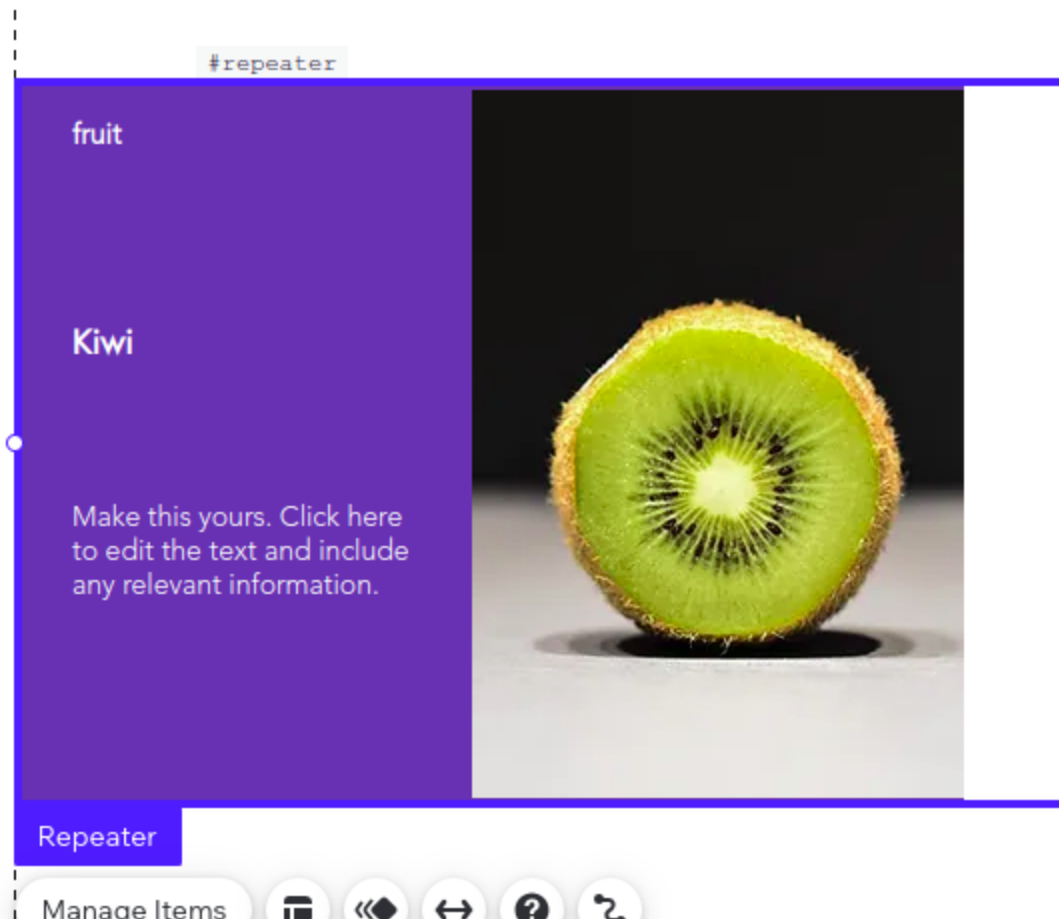

Or import the Products.csv in the attachments in your CMS.

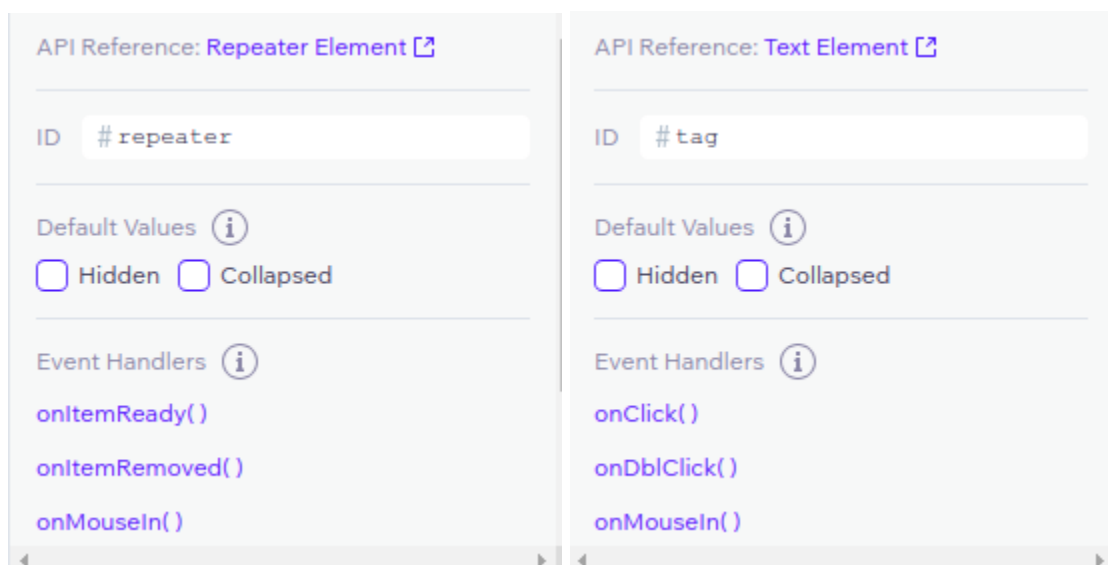

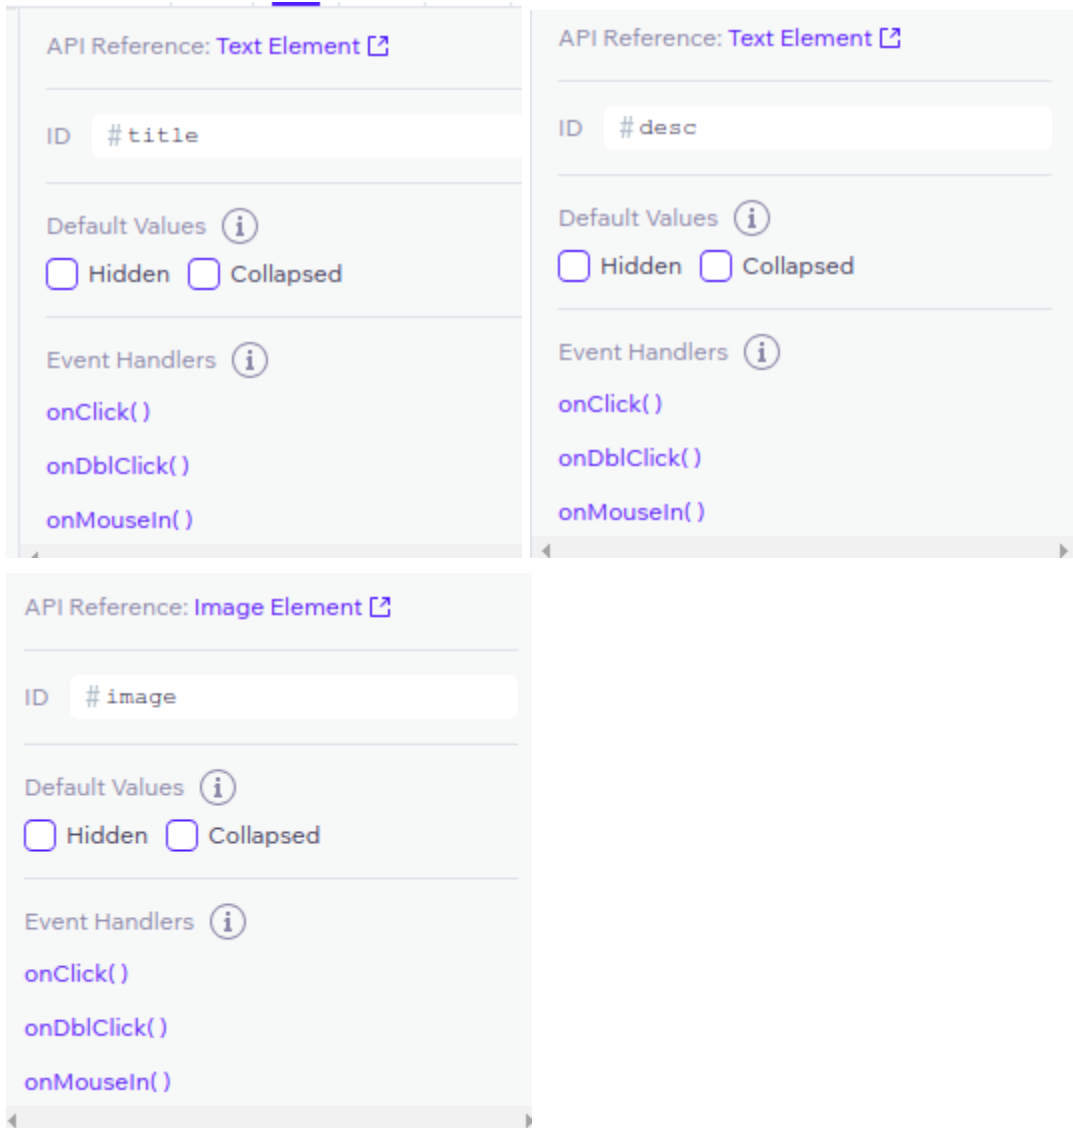

2. Add a Repeater List to show the data from the CMS Database

Important: Make sure that the ID of the repeater and it's elements are as follows else you might have to make changes in the code to reference the correct element.

The code snippet:

```
import wixData from 'wix-data';

function getProductData() {
  let query = wixData.query('Products')

  return query.find().then(results => { return results.items })
}

$w.onReady(function () {
```

```

$w('#repeater').onItemReady((item, itemData) => {
  item('#tag').text = itemData.category
  item("#title").text = itemData.name
  item("#desc").text = itemData.description
  item('#image').src = itemData.image

})

getProductData().then((products) => {
  console.log("product item", products)

  $w('#repeater').data = products;
})

});

```

Running the code will yield the following output if the operation was successful.
